

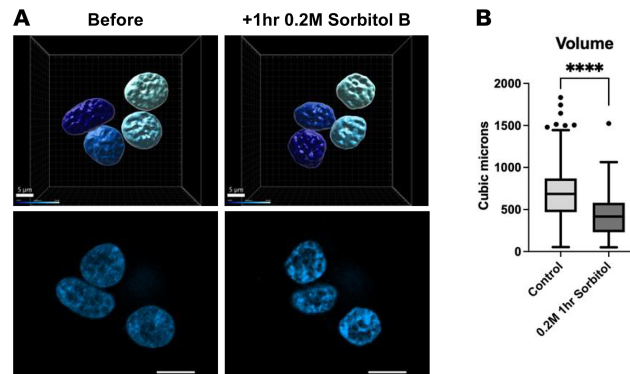

Figure S3. Hyperosmotic stress reduces nuclear volume.

(A) Representative 2D and 3D reconstructions of Hoechst-stained HEK293T nuclei before and after 1 h treatment with 0.2 M sorbitol. Scale bars, 10 μ m.

(B) Quantification of nuclear volume measured from three-dimensional confocal image stacks. Each point represents an individual nucleus (Control, n = 416; Sorbitol, n = 436). Boxplots indicate median and interquartile range; whiskers extend to 1.5 $\times$ IQR. Statistical significance was determined using a two-tailed Welch's t-test (****P < 0.0001).
